FIGURES

- Figure 1 Locality map showing 1:250,000 sheet areas in the Northern Territory south of Latitude 18° S.
- Figure 2 Mapping symbols used in plates 1 to 47

The information contained in this report has been obtained by the Department of National Development, as part of the policy of the Commonwealth Government, to assist in the exploration and development of mineral resources. It may not be published in any form or used in a company prospectus without the permission in writing of the Director, Bureau of Mineral Resources, Geology and Geophysics.

PLATES

Note: Base maps used for these plates are uncontrolled photomosaics (scale 1:253,000 (i.e. 1 inch : 4 miles) approximately) except those marked with an asterisk, which are 1:250,000 planimetric sheets, and those with double asterisks, which are at aerial photograph scale (approximately 1:82,000). All base maps, except for Plate 44A, have been reduced to half-scale to produce the plates for this report.

Introduction

For the purpose of this report, Central Australia is regarded as that part of the Northern Territory south of latitude 18° south. Water bore information for Central Australia, as so defined, other than the Birrindudu 1:250,000 Sheet area (E 52-11), is available in the office of the Resident Geologist, Alice Springs.

The report has been prepared in order to make information on bore locations available to those interested; it has been prompted by a request from Water Resources Branch, Northern Territory Administration. 3976 bores are numbered in the report; about 80% of them are shown on the accompanying plates. The information presented is that available in the office of the Resident Geologist, Alice Springs, as at January, 1967.

Nomenclature system and area covered

Bore data have been organised on a geographical basis, using 4-mile sheets (now produced at scale 1:250,000 and referred to as 1:250,000 sheets) of the Australian grid as the unit. The location of each sheet is shown in Figure 1. Each bore is given a number which consists of the reference number for the 1:250,000 sheet on which it occurs, together with its own sequential number. Thus the fifty-first bore to be recorded on the Hermannsburg sheet will have the number F53/13-51. Only one reference number has been used to record each seismic shot hole line, and some restricted water investigations have been allotted only one reference number. Reference numbers which refer to a group of bore holes are self-explanatory in the appendix.

Recording of Data

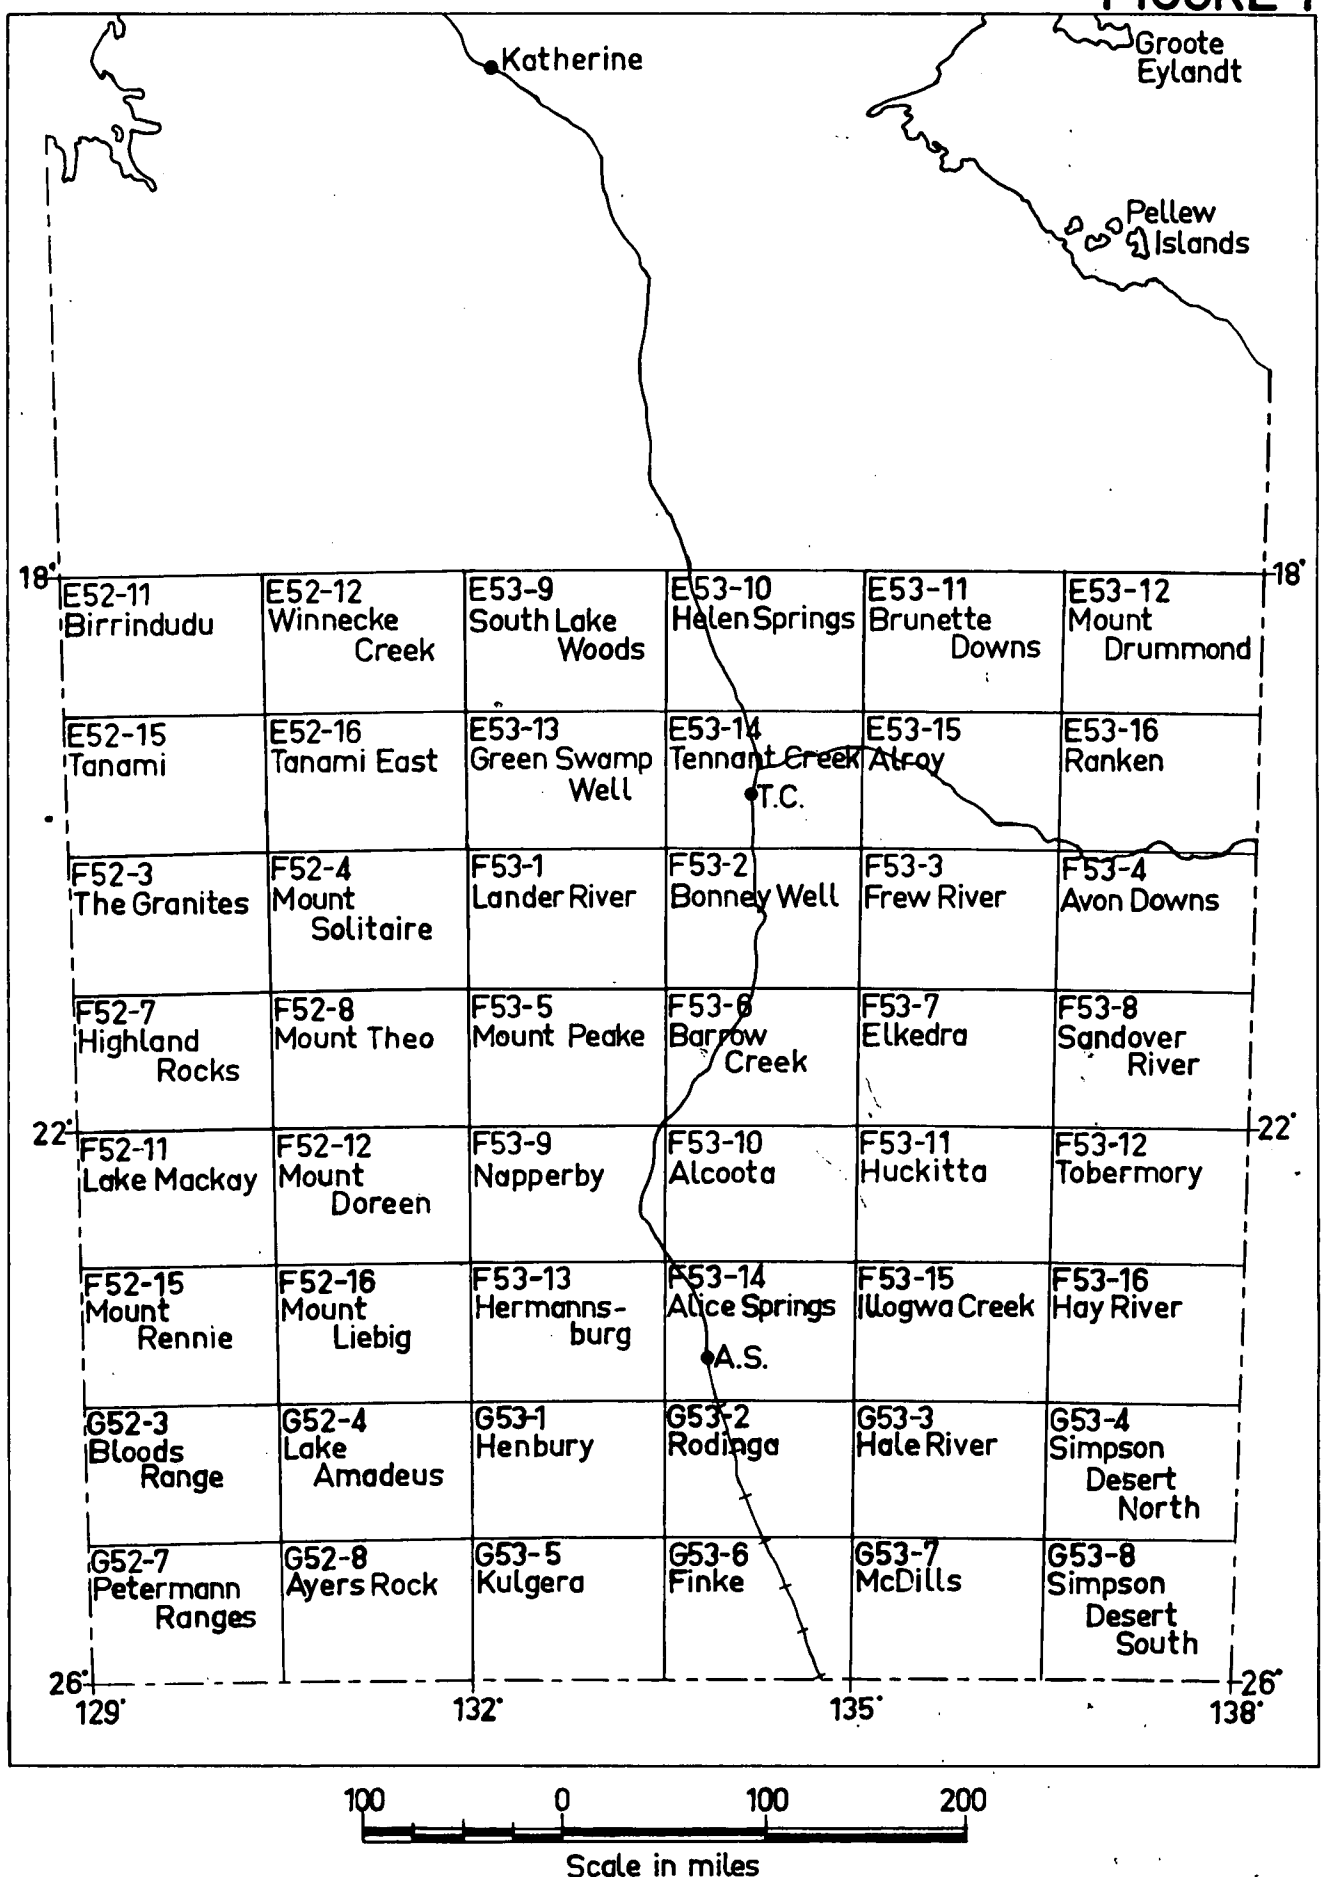

Bore data have been filed on the basis of the 1:250,000 sheet classification used in the numbering system. Each bore data file, which contains data from all known bores in a particular 1:250,000 sheet area, has an index sheet listing bore number, bore name, and the pastoral property on which it occurs. These index sheets are reproduced in this report (see Appendix) as a key to the bore numbers plotted on the maps.

Plotting of Data

Every bore whose location is known accurately enough to be plotted on aerial photographs at a scale of about one mile to $1\frac{1}{4}$ inches, has been recorded on the enclosed maps (Plates 1 to 47). Most known bores fall into this category. The method of plotting was to find the position of the bore on the appropriate aerial photograph, and then transfer the point to a photomosaic at 4-mile scale. A transparent overlay was then prepared, showing only the surface drainage pattern and bore localities. These overlays are held in the Alice Springs geological office and will be kept up-to-date. They have been reduced to half scale (1 inch : 8 miles) to give the maps which accompany this report. Photomosaics at 4-mile scale were not available for the following 1:250,000 sheet areas:

Alroy
Avon Downs
Bloods Range
Brunette Downs
Lake Mackay
Mount Drummond
Mount Rennie

Petermann Ranges
Ranken
Sandover River
Simpson Desert North
Simpson Desert South
South Lake Woods
Winnecke Creek

LOCALITY MAP SHOWING 1:250,000 SHEET AREAS IN THE
NORTHERN TERRITORY SOUTH OF LATITUDE 18°

Bores shown on these sheets have been plotted on planimetric maps produced by Department of National Mapping at a scale of 1:250,000. A transparent overlay was then prepared as for the photomosaic maps at 4-mile scale. These overlays are also reproduced in the report at half scale.

Bores whose locations are not accurately known have not been plotted, and are marked with an asterisk in the appendix. About 900 bores which lie in the Alice Springs Town and Farm areas have not been plotted on the Alice Springs Sheet. Neither do these bores appear in the Appendix. It is proposed to produce a separate report covering all bore locations on the Alice Springs 1:250,000 Sheet, together with all the known data for these bores. Kingdom was responsible for all plotting.

Acknowledgements

The system of storage of bore data used as the basis for the report was commenced while N. Jones and T. Quinlan were attached to the Resident Geologist's Office. Pastoral maps prepared by Lands Branch, Northern Territory Administration, and 1:250,000 planimetric maps prepared by National Mapping Division of the Department of National Development, have been used in some cases to assist with the location of bores. Locations for some of the bores on the Mount Drummond, Brunette Downs, Alroy, and Ranken sheets have been plotted from Randal (1967).
