ABSTRACT

The Bureau of Mineral Resources, Geology and Geophysics (now Australian Geological Survey Organisation) carried out an extensive program of geophysical logging of waterbores in the Great Artesian Basin during the 1960s and 1970s. A total of 1235 boreholes were logged in Queensland, New South Wales and the Northern Territory.

The suite of logs obtained included one or more of: natural gamma, neutron-gamma, temperature, differential-temperature, flowmeter, caliper, spontaneous-potential, resistivity and casing-collar locator logs. The analogue traces of the wire-line logs have been digitised under funding provided by the National Landcare Program, and are to be released as digital data on CD-ROM. The CD-ROM will also include data on the logs, data on the waterbores logged, their lithostratigraphy and hydrochemistry. This data set on CD-ROM, together with maps showing the locations of the wire-line logged waterbores, will be published as AGSO Bulletin 240.

The Great Artesian Basin Wire-Line Log (GABLOG) database, the subject of this documentation, contains general data on the waterbores logged, the types of wire-line logs for each borehole, hydrochemical analyses and stratigraphic interpretations. The GABLOG database is implemented with version 7 of the Oracle RDBMS. The data is held in five tables, and two sets of views of the data have been developed to enhance the utility of the package - one allows data conversion into enduser databases and the other is set up for conversion into enduser spreadsheets.

We expect that the user-friendly format of the GABLOG database will be of great assistance to the state water and geological authorities, and to the petroleum and mining exploration industry and other users.

1. INTRODUCTION

The structure and detailed layout of the Great Artesian Basin Wire-Line Log (GABLOG) database is described in this record.

The GABLOG database holds borehole data, interpreted stratigraphic data, hydrochemical data, and wire-line log availability data from approximately 1235 waterbores in the Great Artesian Basin. The data has been gathered by the Bureau of Mineral Resources, Geology and Geophysics (BMR, now AGSO) during the 1960's and 1970's (M.A. Habermehl, 1985). The database lists the availability and formats of geophysical logs (natural gamma-ray, neutron-gamma, temperature, differential temperature, flowmeter, caliper, resistivity and spontaneous potential), along with the results of hydrochemical analyses and lithostratigraphic interpretations of the wire-line logs. Data derived from the GABLOG database will be included on a CD-ROM containing the digitised wire-line logs.

The wire-line log availability data has been released previously as BMR Report 241 (Habermehl & Morrissey, 1983). Copies of the wire-line logs have been available on paper from AGSO and can be purchased on request. An earlier database designed in 1980 (Habermehl, 1980) was used to store (on 80 column computer cards) some of the information held in the GABLOG database. The earlier database is no longer accessible, though some of the information has been included in BMR Report 241. The GABLOG database is an expanded and updated dataset, which contains data on the waterbores logged, the wire-line logs, hydrochemical data and stratigraphic interpretations of the wire-line wire-line logs (the latter from B.R. Senior & Associates Pty. Ltd).

The GABLOG database described in this report has been implemented with the Oracle RDBMS (Relational Database Management System) (Oracle, 1993). The availability of Oracle version 7, with a new new feature, "constraints", has enhanced the design and implementation of the GABLOG database. The implementation of the database is described in chapter 2. No forms based interface has been implemented: end-users of the database will access the data from a variety of hardware and software platforms. A glossary of some of the terms used in this record can be seen in Lenz et. al. (1993).

The complete and current GABLOG data set, along with digital wire-line log data, will be released on CD-ROM, together with a set of three maps showing the locations of the wire-line logged waterbores, as AGSO Bulletin 240.

An overview of the development database is shown in Figure 1. Two sets of views of the data have been developed to allow the data to be readily distributed: these views can be seen in Figures 2 and 3. The database structure is discussed in more detail in Chapters 3, 4 and 5 of this document.

2. IMPLEMENTING THE GABLOG DATABASE WITH ORACLE

The GABLOG database was designed to store data and information about AGSO's collection of wire-line well logs from the Great Artesian Basin. Also, it was necessary to consider requirements that the data be internally consistent, and that control be maintained over the

data to be distributed. Consequently, the GABLOG database was implemented on AGSO's corporate database server. This is a well maintained and reliable system, that supports version 7 of the Oracle RDBMS (Lenz, 1993).

2.1 Constraints

Oracle version 7 has allowed constraints on data to be implemented during the design of the database. The use of these constraints can help ensure that:

- Data values in a given field fall within acceptable limits. For example, a check constraint can be used to ensure that a chemical concentration is null, or greater than or equal to zero
- Data in one field of a record is logically consistent with data in other fields within the same table. For example, a check constraint can be used to ensure that the data value for the top of a wire-line log is above the data value for the bottom of the wire-line log
- Referential integrity is maintained between related tables. For example, a referential integrity constraint can be used to ensure that each wire-line log record has a matching record in a table storing borehole location details

2.2 Views

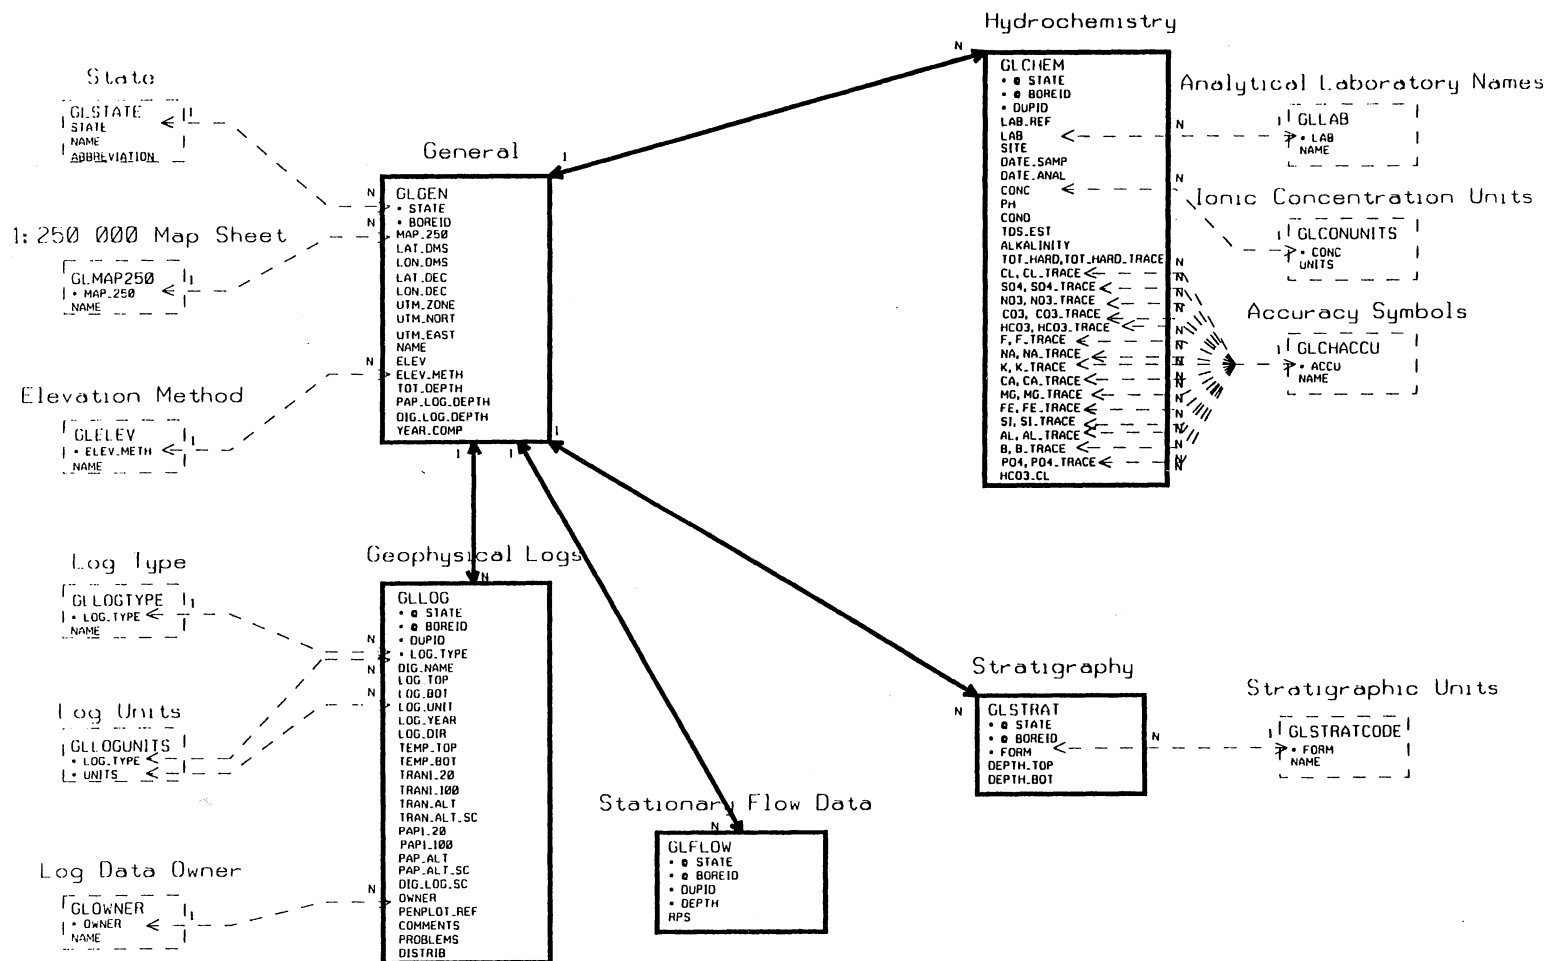

Two factors have motivated the use of Oracle views for the GABLOG database.

- Some digitised wire-line logs listed in the GABLOG database are not distributable by AGSO - these logs may, for example, have been produced for a private company.
- The end-users of the distributed data may not have access to an Oracle RDBMS - and they may be limited to any one of a number of PC or Macintosh database or spreadsheet applications. Therefore, on the distribution media for the GABLOG database and digitised wire-line logs, the database has been stored as flat files, with the definitions originally held in authority tables transferred into the data tables. The database is also stored on the distribution media as an Oracle 7 export file.

Two sets of views on the database have been defined. The first set of views is designed to aid transfer of the GABLOG data into other databases, and the second is for data conversion into spreadsheets. Neither of the two sets of views include data that is not distributable by AGSO. Both views integrate look up (or authority) table data with the data tables. The views created for spreadsheets also integrate bore location data with each record in the hydrochemistry, flow, stratigraphy and geophysical log description tables, thereby reducing the need to cross-reference spreadsheets when selecting data for spatial analysis.

Figure 1: Diagram of relationships between GABLOG database tables

GREAT ARTESIAN BASIN WIRE-LINE LOG DATABASE

- Data Table
- Look Up Table
- Primary Key (Data Table)
- Foreign Key (Data Table)

3. DATA TABLES

GABLOG data is held in five tables:

GLGEN: holds general information about each bore, including bore location data.

GLLOG: holds information describing each of the digitised wire-line logs.

GLFLOW: holds stationary flow data measured during impeller flow meter tests. Interpreted

GLSTRAT: holds stratigraphic data.

GLCHEM: holds hydrochemical data.

The primary keys for the GLGEN table are the state and boreid columns, these columns are also foreign keys for each of the remaining four data tables.

These are also several look up tables, which are useful in providing consistency checks on values in the data tables:

GLSTATE: holds state names and abbreviations for those states covering portions of the GAB.
GLMAP_250: stores 1:250 000 map sheet names and codes for those map sheets covering or partially covering the GAB.

GLELEV: holds methods for measuring the elevation of the bores.

GLLOGTYPE: holds a list of the valid types of geophysical logs held in the database.

GLLOGUNITS: holds a list of the valid units for each geophysical log type.

GLSTRATCODE: holds a list of formation names and abbreviations for the GAB.

GLCHACCU: holds a list of codes representing the accuracy of data.

GLCONUNITS: holds allowable concentration units.

GLLAB: stores valid laboratory names and their abbreviations.

A diagram of the relationship between tables is shown in Figure 1.

To maintain consistency with existing hardcopy log originals, all depth measurements have been given in feet. The original chemical concentration units listed in the analytical laboratory result sheets have also been maintained.

3.1 GLGEN

The GLGEN table holds the bore location and bore name of each water-bore, the year that drilling was completed, the depth of the bore, the greatest depth reached by both the original and digitised geophysical logs, and the elevation of the bore. Note that the total depth (tot_depth) of the bore may be considerably different from the maximum depth of the digitised wire-line logs: the bore may have been deepened after its initial construction, the bore may also have become blocked at some point, preventing wire-line logging below the depth of the obstruction. The primary keys are the state and boreid fields.

state: state code, referencing **GLSTATE.STATE** look up table. One character.

boreid: state registration number or bore name. Character field with a maximum length of six characters.

lat_DMS: latitude, in degrees, minutes and seconds. Character field, format "nn nn nn" (positive southwards)

lon_DMS: longitude, in degrees, minutes and seconds, format "nnn nn nn"

lat_dec: latitude, as a decimal number, format "nn.nnnnnnnn" (positive southwards)
lon_dec: longitude, as a decimal number, format "nnn.nnnnnnnn"
utm_zone: universal transverse mercator zone, numeric, format "nn" (range 53-56)
UTM_east: UTM easting, meters, numeric, format "nnnnnnnnnnnn.nn"
UTM_nort: UTM northing, meters, numeric, format "nnnnnnnnnnnn.nn"
map_250: UTM 1:250 000 mapsheet code. References **GLMAP250.MAP_250**. Character field, format "SA₁-5A₂", where A₁ is in the range "C"- "I", and A₂ is in the range "3"- "6".
name: full name of bore. Character field of maximum length 35.
elev: elevation of groundsurface in feet with respect to the Australian height datum. (AHD). Numeric field with format "nnnnn.n"
elev_meth: method by of elevation measurement, referencing **GLELEV.ELEV_METH**. A character field of length one.
tot_depth: total depth of bore in decimal feet, measured from groundsurface. Numeric field with format "nnnnn.n"
pap_log_depth: greatest depth of any of the logs for this bore as shown on original wire-line logs, in decimal feet, measured from groundsurface. Numeric field with format "nnnnn.n".
dig_log_depth: greatest depth of digital copies of any of the logs for this bore, in feet, measured from groundsurface. Numeric field with format "nnnnn.n".
year_comp: year the initial drilling was completed. Numeric field, with format "nnnn", and with values in the range 1870-1999.

3.2 GLLOG

This table holds descriptions of each geophysical log, and the scales and formats in which the data is available. The primary keys are the state, boreid, and dupid fields. Most of the original geophysical logs are available in both 1 inch:20 foot and 1 inch: 100 foot scales. Some are available at another scale. The original logs were recorded on transparent film, which are stored in AGSO and paperprint copies also held at AGSO. The tran1_20, tran1_100, tran_alt, pap1_20, pap1_100, pap_alt fields indicate the media and the scale of the original logs. Where a scale other than 1 inch: 100 foot or 1 inch: 20 foot has been used for the original log, this scale is indicated in the tran_alt_sc or pap_alt_sc fields. The scale of the original log that was digitised to produce a log for distribution on the CD-ROM is stored in the dig_log_sc field.

state: state code. Character field of length one.
boreid: state registration number or bore name. Character field with a maximum length of six characters.
dupid: code of duplicate log for the bore, null for first geophysical log recorded, "b", "c", "d" etc for subsequent logs. Character length 1 or 0, range "b" - "z"
log_type: type of the geophysical log, referencing **LOGTYPE.LOG_TYPE**. Character string of length 1-3.
dig_name: name of the file containing the digitised log data (MS-DOS compatible). Character field with format "BBBBBBC.DDD" where A is the state code, BBBBBB is the bore i.d., C is the duplicate code (if present), and DDD is the log type.
log_top: highest depth logged relative to groundsurface, feet. Numeric field with format "nnnnn.n".
log_bot: lowest depth logged relative to groundsurface, feet. Numeric field with format "nnnnn.n".

log_unit:	units of the geophysical log, character, length 10. Referencing GLLOGUNIT.UNITS look up table. Character field of maximum length 10.
log_dir:	The probe movement, either upwards or downwards during logging. Character field of maximum length 4, with two permissible values, "up" or "down".
log_year:	the year the bore was logged. Numeric field with format "nnnn".
temp_top:	the temperature of the groundwater at ground surface, in degrees Celsius. Is only non-null for temperature logs. Numeric field with format "nnn.nn".
temp_bot:	the temperature of the groundwater at the bottom of the log, in degrees Celsius. Only used for temperature logs. Numeric field with format "nnn.nn".
tran1_20:	availability as transparent original at 1"-20' depth scale. Character field with value of either "y" or "n".
tran1_100:	available as transparent original at 1"-100' depth scale. Character field with value either "y" or "n".
tran_alt:	available as transparent original at non-standard scale. Character field with value either "y" or "n".
tran_alt_sc:	alternate depth scale of log on transparent original. Character field with maximum length 15.
pap1_20:	availability as paper copy at 1"-20' depth scale. Character field with value either "y" or "n".
pap1_100:	availability as paper copy at 1"-100' depth scale. Character field with value either "y" or "n".
pap_alt:	availability as paper copy at non-standard scale. Character field with value either "y" or "n".
pap_alt_sc:	alternate depth scale of log on paper copy. Character field with maximum length of 15 characters.
dig_log_sc:	the scale of the hardcopy log from which the wire-line log was digitised. Character field with maximum length 15.
owner:	the owner of the log, referencing GLOWNER.owner . The owner of the log is that person or organisation which acquired the original log and which controls the distribution of the log. Character field of maximum length 5.
penplot_ref:	reference to the index system for disks and paper check prints of the data. Character field of maximum length 10.
comments:	description of any problems encountered during the geophysical logging of the bore. Character field of maximum length 100.
problems:	description of any problems encountered during digitising of the geophysical wire-line log. Character field of maximum length 100.
distrib:	Distribution status. Character field with value either "y" or "n".

3.3 GLCHEM

This table stores the results of hydrochemistry analyses data obtained in the laboratory for each water bore. The primary keys are the state, boreid and dupid fields.

state:	state code. Character field of length one.
boreid:	state registration number or bore name. Character field with a maximum length of six characters.
dupid:	code of duplicate analysis for the bore, null for first geophysical log recorded, b,c,d etc for subsequent logs. Character field of length one, range "b"-z".
lab_ref:	laboratory reference number of the sample. Character field, maximum length of 20 characters.

lab:	abbreviated name of the organisation which analysed the chemical data, referencing GLLAB.GLLAB . Character field of maximum length 8.
site:	description of the sample site. Character field of maximum length 40.
date_samp:	date of sample collection.
date_anal:	date of sample analysis.
conc:	concentration units for ionic analyses, referencing GLCONUNITS.CON . Character field of maximum length 4.
pH:	pH of the sample. Numeric field with format "nn.nn"
cond:	electrical conductivity of the sample, in microsiemens/cm. Numeric field with format "nnnnn".
TDS_est:	estimated TDS in ppm (parts per million). Numeric field with format "nnnnnn".
alkalinity:	as CaCO ₃ in ppm. Numeric field with format "nnnnn".
tot_hard:	total hardness as calcium and magnesium salts as CaCO ₃ in ppm. Numeric field with format "nnnnn.nn".
Cl:	chloride concentration. Numeric field with format "nnnnn.nn".
Cl_trace:	trace symbol for chloride concentration value, referencing GLCHACCU.ACCU . Character field of length 1.
SO4:	sulphate concentration. Numeric field with format "nnnnn.nn".
SO4_trace:	trace symbol for sulphate concentration value, referencing GLCHACCU.ACCU . Character field of length 1.
NO3:	nitrate concentration. Numeric field with format "nnnnn.nn".
NO3_trace:	trace symbol for nitrate concentration value, referencing GLCHACCU.ACCU . Character field of length 1.
CO3:	carbonate concentration. Numeric field with format "nnnnn.nn".
CO3_trace:	trace symbol for carbonate concentration value, referencing GLCHACCU.ACCU . Character field of length 1.
HCO3:	bicarbonate concentration. Numeric field with format "nnnnn.nn".
HCO3_trace:	trace symbol for bicarbonate concentration value, referencing GLCHACCU.accu . Character field of length 1.
F:	fluoride concentration. Numeric field with format "nnnnn.nn".
F_trace:	trace symbol for fluoride concentration value, referencing GLCHACCU.ACCU . Character field of length 1.
Na:	sodium concentration. Numeric field with format "nnnnn.nn".
Na_trace:	trace symbol for sodium concentration value, referencing GLCHACCU.ACCU . Character field of length 1.
K:	potassium concentration. Numeric field with format "nnnnn.nn".
K_trace:	trace symbol for potassium concentration value, referencing GLCHACCU.ACCU . Character field of length 1.
Ca:	calcium concentration. Numeric field with format "nnnnn.nn".
Ca_trace:	trace symbol for calcium concentration value, referencing GLCHACCU.ACCU . Character field of length 1.
Mg:	magnesium concentration. Numeric field with format "nnnnn.nn".
Mg_trace:	trace symbol for magnesium concentration value, referencing GLCHACCU.ACCU . Character field of length 1.
Fe:	iron concentration. Numeric field with format "nnnnn.nn".
Fe_trace:	trace symbol for iron concentration value, referencing GLCHACCU.ACCU . Character field of length 1.
Si:	silica concentration. Numeric field with format "nnnnn.nn"
Si_trace:	trace symbol for silica concentration value, referencing GLCHACCU.ACCU . Character field of length 1.

Al: aluminium concentration. Numeric field with format "nnnnn.nn". (note: no aluminium values present in the database)

AL_trace: trace symbol for aluminium concentration value, referencing **GLCHACCU.ACCU**. Character field of length 1.

B: boron concentration. Numeric field with format "nnnnn.nn".

B_trace: trace symbol for boron concentration value, referencing **GLCHACCU.ACCU**. Character field of length 1.

PO4: phosphate concentration. Numeric field with format "nnnnn.nn".

PO4_trace: trace symbol for phosphate concentration value, referencing **GLCHACCU.ACCU**. Character field of length 1.

HCO3_Cl: bicarbonate/chloride ratio. Numeric format "nnnnn.nnnnn".

3.4 GLSTRAT

This table holds lithostratigraphic data that were interpreted from the geophysical logs by Dr B.R. Senior & Associates, Pty. Ltd while under contract to AGSO. The state, boreid, and form fields are the primary keys for the GLSTRAT table.

state: state code. Character field of length one.

boreid: state registration number or bore name. Character field with a maximum length of six characters.

depth_top: depth from ground surface to the top of formation (feet). Numeric field with format "nnnnn.n"

depth_bot: depth from ground surface to bottom of formation (feet). Numeric field with format "nnnnn.n"

form: formation abbreviation. Referencing **GLSTRATCODE.FORM**. Character field with maximum length 12.

3.5 GLFLOW

This table holds stationary flow measurements made during flowmeter logging.

state: State code. Character field of length one.

boreid: state registration number or bore name. Character field with a maximum length of six characters.

dupid: code of duplicate log for the bore, null for first geophysical log recorded, "b", "c", "d" etc for subsequent logs. Character length 1, range "b"- "z"

depth: Depth from ground surface in feet, at which flow measurement was made. Numeric field with format "nnnn.n".

rps: flow rate, in impeller flowmeter revolutions per second. Numeric field with format "nnnn.n".

4. LOOKUP TABLES

4.1 GLSTATE

The GLSTATE table holds valid state names for bores in the GABLOG database and their abbreviations. The state field is the primary key.

state: State code, character string, character, format "n"
name: full name of State, character string of maximum length 20
abb: abbreviated name of State, character, maximum length 3

State Abbreviation	Abbreviation	State Name
n	NSW	New South Wales
q	Qld	Queensland
s	SA	South Australia
t	NT	Northern Territory

4.2 GLMAP250

This table contains 1:250 000 AMG mapsheets that cover most of the area of the Great Artesian Basin. The map_250 field is the primary key for the table.

map_250: UTM mapsheet code. Character, format "SA₁-5A₂", where A₁ is in the range "C"-
"I", and A₂ is in the range "3"-6". Character field of length 6.
name: UTM 1:250 000 mapsheet name. Character field of maximum length 25.

4.3 GLOWNER

The data in the GLOWNER table lists valid owners of the log data. The owner field is the primary key for the table.

Owner: abbreviated name of owner of the LOG. Character field of maximum length 8.
Name: the name of the organisation owning the log. Character field of maximum length 60.

The current values are:

OWNER	Owner Abb.
Australian Geological Survey Organisation	AGSO
American Overseas Petroleum Ltd	AOP
CYPLUS NRAP	CYPLUS
CRA	CRA
Winton Shire Council	WSC
Geological Survey of Queensland	GSQ
Zinc Corp Ltd	ZC
Mines Administration Pty Ltd	MA
North American International	NAI
Mid Eastern Oil NL	MEO
South Australian Department of Mines and Energy	SADME

4.4 GLSTRATCODE

The data in the GLSTRATCODE table is a list of allowable stratigraphic unit names and abbreviations. The form field is the primary key for the table.

form: Abbreviation for formation code. Character field of maximum length 12 characters.

name: lithostratigraphic unit name. Character field of maximum length 30.

The values in the table (the first two columns are sorted by formation name, the second two columns are ordered by formation name, and formation code) are:

ORDERED BY FORMATION NAME		ORDERED BY FORMATION CODE	
FORMATION NAME	CODE	CODE	FORMATION NAME
Adori Sandstone	Ja	Bas	Basement

4.5 GLLOGTYPE

The GLLOGTYPE field holds valid geophysical log types and their abbreviations. The log_type field is the primary key for the table.

log_type: abbreviation of the geophysical log type. Character field of maximum length 3.
name: nature of the geophysical log. Character field of maximum length of 25.

The values in the GLLOGTYPE table are:

Log Type	Name
qr	natural gamma ray
neu	neutron-gamma ray
t	temperature
dt	differential temperature
cal	caliper
fld	flowmeter logged down
flu	flowmeter logged up
rln	long normal resistivity
rlt	lateral resistivity
rsn	short normal resistivity
sp	spontaneous potential
spr	single point resistance

4.6 GLLOGUNITS

The GLLOGUNITS table lists the valid log units for each type of geophysical log. The log_type and units fields are the primary keys for the table.

log_type: log type abbreviation, referencing GLLOGTYPE.LOG_TYPE. Character field with maximum length 3.
units: acceptable units for the log type. Character field with maximum length 10.

The values in the GLLOGUNITS table are:

Log Type Abbreviation	Valid Units	Unit Description
-----------------------	-------------	------------------

Log Type Abbreviation	Valid Units	Unit Description
gr	API	American Petroleum Institute Units
gr	COUNTS/MIN	counts per minute
gr	CPS	counts per second
gr	mR/hr	milliroentgen per hour
neu	API	American Petroleum Institute Units
neu	CPS	counts per second
t	celsius	degrees Celsius
dt	diff_t	differential temperature units
cal	inches	
fld	RPS	rotations per second
flu	RPS	rotations per second
rln	ohm.m	ohm metres
rt	ohm.m	ohm metres
rsn	ohm.m	ohm metres
sp	mV	millivolts
spr	ohms	

Units recorded as API are those defined by the American Petroleum Association for gamma-ray and neutron-gamma counts. RPS is an abbreviation for flow meter impeller revolutions per second.

4.7 GLELEV

The data in the GLELEV table lists valid elevation estimation methodologies and codes. The elev_meth field is the primary key for the table.

Elev_meth: Elevation measurement method code. Character field of length 1.

Name: Elevation measurement method name. Character field of maximum length 30.

The values in the GLELEV table are:

Elevation Measurement Method Abbreviation	Elevation Measurement Method
B	Barometer
M	Estimated from topographic map
S	Survey
U	Unknown

4.8 GLCONUNITS

The GLCONUNITS table lists valid values for concentration units of the ionic concentrations in the GLCHEM table. The conc field is the primary key for the table.

conc: abbreviation for the concentration units

name: full name of the concentration units

The values in the GLCONUNITS table are:

Conc. Units	Name
ppm	parts per million
mg/L	milligrams per litre

4.9 GLCHACCU

The GLCHACCU table lists valid accuracy or limiting symbols for the ionic concentration data held in the GLCHEM table. The accu field is the primary key for the table.

accu: symbol indicating accuracy or limit of the measurement. Character field of length 1.
name: description of the nature of the accuracy or limit. Character field of maximum length 30.

The values in the GLCHACCU table are:

Accuracy	Name
T	traces detected
N	not detected
<	actual value is less than the stated concentration value

4.10 GLLAB

The GLLAB table holds a list of the laboratories which performed the hydrochemical analyses. The lab field is the primary key for the database.

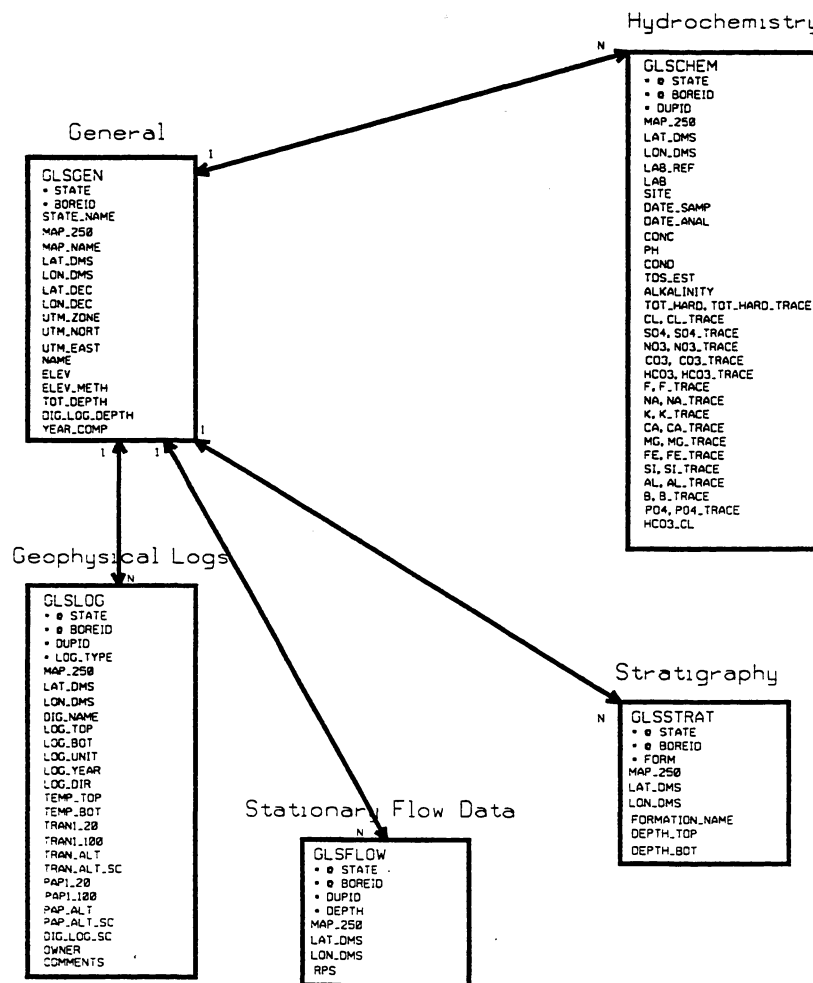

LAB: Laboratory name abbreviation. Character field of maximum length 8.
NAME: Laboratory name. Character field of maximum length 60.

The values in the GLLAB table are:

Laboratory	Name
QCGLB	Qld Government Chemical Laboratory, Brisbane
NSWDMCL	NSW Department of Mines Chemical Laboratory
NTAWRB	NT Administration Water Resources Board

■ Data Table
• Primary Key (Data Table)
• Foreign Key (Data Table)

5. Views

A rationale for the use of views was presented in Chapter 2. The views created for the GABLOG database fall into one of two categories:

- views suitable for spreadsheets (view name prefaced by “GLS”) - Figure 2
- views suitable for databases (view name prefaced by “GLV”) - Figure 3

The primary differences between the views of the data and the base tables are that:

- only data that is distributed on the CD-ROM is presented in the views.
- look up table data is merged with the data tables.
- bore hole latitudes and longitudes are included in all records of the spreadsheet views.

5.1 GLVGEN

The GLVGEN view holds the bore location and bore name of each bore, along with the year that drilling was completed, the depth of the bore, the greatest depth reached by both the original and digitised geophysical logs, and the elevation of the bore. Note that the total depth (tot_depth) of the bore may be considerably different from the maximum depth of the digitised wire-line logs: the bore may have been deepened after its initial construction, the bore may also have become blocked at some point, preventing wire-line logging below the depth of the obstruction. The primary keys are the state and boreid fields.

state:	state code, (n for NSW, q for Queensland, s for South Australia, t for Northern Territory). One character.
boreid:	state registration number or bore name. Character field with a maximum length of six characters.
state_name:	the full name of the state.
lat_DMS:	latitude, in degrees, minutes and seconds. Character field, format “nn nn nn” (positive southwards)
lon_DMS:	longitude, in degrees, minutes and seconds, format “nnn nn nn”
lat_dec:	latitude, as a decimal number, format “nn.nnnnnnnn” (positive southwards)
lon_dec:	longitude, as a decimal number, format “nnn.nnnnnnnn”
utm_zone:	universal transverse mercator zone, numeric, format “nn” (range 53-56)
UTM_east:	UTM easting, meters, numeric, format “nnnnnnnnnnnn.nn”
UTM_nort:	UTM northing, meters, numeric, format “nnnnnnnnnnnn.nn”
map_250:	UTM 1:250 000 mapsheet code. A character field, format “SA ₁ -5A ₂ ”, where A ₁ is in the range “C”-“I”, and A ₂ is in the range “3”-“6”.
map_name:	1:250 000 mapsheet name, of maximum length 25 characters.
name:	full name of bore. Character field of maximum length 35.
elev:	elevation of groundsurface in feet with respect to the Australian Height Datum. (AHD). Numeric field with format “nnnnn.n”
elev_meth:	method by which elevation was measured.
tot_depth:	total depth of bore in feet, measured from groundsurface. Numeric field with format “nnnnn.n”

dig_log_depth: greatest depth of digital copies of any of the logs for this bore, in feet, measured from ground surface. Numeric field with format "nnnnn.n".

year_comp: year the initial drilling was completed. Numeric field, with format "nnnn", and with values in the range 1870-1999.

5.2 GLVLOG

This view holds descriptions of each geophysical log, and the scales and formats in which the data is available. The original geophysical logs are in both 1 inch:20 foot and 1 inch: 100 foot scales. Some logs are available at other scales. The originals were recorded on transparent film, and paper copies and the original films are held at AGSO. The tran1_20, tran1_100, tran_alt, pap1_20, pap1_100, pap_alt fields indicate the media and scale of original logs. Where a scale other than 1 inch: 100 foot or 1 inch: 20 foot has been used for the original log, this scale is indicated in the tran_alt_sc or pap_alt_sc fields. The scale of the original log that was digitised to produce a log for distribution on the CD-ROM is stored in the dig_log_sc field.

state: state code, (n for NSW, q for Queensland, s for South Australia, t for Northern Territory). Character field of length one.

boreid: state registration number or bore name. Character field with a maximum length of six characters.

log_type: type of the geophysical log. Character string of length 1-3. One of the following:

gr	natural gamma ray
neu	neutron gamma ray
t	temperature
dt	differential temperature
cal	caliper
fld	flow (logged downwards)
flu	flow (logged upwards)
rln	long normal resistivity
rlt	lateral resistivity
rsn	short normal resistivity
sp	spontaneous potential
spr	single point resistance

dupid: code of duplicate log for the water bore, null for first geophysical log recorded, "b","c","d" etc for subsequent logs. Character length 1 or 0, range "b" - "z"

dig_name: name of the file containing the digitised log data (MS-DOS compatible). Character field with format "BBBBBBC.DDD" where A is the state code, BBBBBB is the bore i.d., C is the duplicate code (if present), and DDD is the log type.

log_top: highest depth logged relative to ground surface, in decimal feet. Numeric field with format "nnnnn.n".

log_bot: lowest depth logged relative to ground surface, in decimal feet. Numeric field with format "nnnnn.n".

log_unit: units of the geophysical log, character, length 10.

log_dir: Did the probe moved upwards or downwards during logging ? Character field of maximum length 4, with two permissible values, "up" or "down".

log_year: the year the bore was logged. Numeric field with format "nnnn".

temp_top: the temperature of the groundwater at ground surface, in degrees Celsius. Is only non-null for temperature logs. Numeric field with format "nnn.nn".

temp_bot: the temperature of the groundwater at the bottom of the bore, in degrees Celsius. Only used for temperature logs. Numeric field with format "nnn.nn".

tran1_20: availability as transparent original at 1"-20' depth scale. Character field with value of either "y" or "n".

tran1_100: availability as transparent original at 1"-100' depth scale. Character field with value either "y" or "n".

tran_alt: availability as transparent original at non-standard scale. Character field with value either "y" or "n".

tran_alt_sc: alternate depth scale of log on transparent original. Character field with maximum length 15.

pap1_20: availability as paper copy at 1"-20' depth scale. Character field with value either "y" or "n".

pap1_100: availability as paper copy at 1"-100' depth scale. Character field with value either "y" or "n".

pap_alt: availability as paper copy at non-standard scale. Character field with value either "y" or "n".

pap_alt_sc: alternate depth scale of log on paper copy. Character field with maximum length of 15 characters.

dig_log_sc: the scale of the hardcopy log from which the wire-line log was digitised. Character field with maximum length 15.

owner: the owner of the log. Character field of maximum length 60.

comments: description of any problems encountered during the geophysical logging of the bore, or any problems encountered during digitising of the geophysical wire-line log. Character field of maximum length 100.

5.3 GLVCHEM

This view stores the results of hydrochemistry laboratory analyses for each bore sampled for hydrochemistry. The various trace fields for ionic concentration fields may have one of the following values:

T	traces detected
N	not detected
<	actual value is less than the stated value

state: state code, (n for NSW, q for Queensland, s for South Australia, t for Northern Territory). Character field of length one.

boreid: state registration number or bore name. Character field with a maximum length of six characters.

dupid: code of duplicate analysis for the bore, null for first geophysical log recorded, b,c,d etc for subsequent logs. Character field of length one, range "b"- "z".

lab_ref: laboratory reference number of the sample. Character field, maximum length of 20 characters.

lab: name of the organisation which analysed the chemical samples. Character field of maximum length 60.

site: description of the sample site. Character field of maximum length 40.

date_samp: date the sample was taken.

date_anal: date the sample was analysed.

conc: concentration units for ionic analyses, either "ppm" for parts per million, or "mg/l" for milligrams per litre. Character field of maximum length 4.

pH: pH of the sample. Numeric field with format "nn.nn"

cond:	sample electrical conductivity, in microsiemens/cm. Numeric field with format "nnnnn".
TDS_est:	estimated TDS in ppm (parts per million). Numeric field with format "nnnnnn".
alkalinity:	as CaCO ₃ in ppm. Numeric field with format "nnnnn".
tot_hard:	total hardness as calcium and magnesium salts as CaCO ₃ in ppm. Numeric field with format "nnnnn.nn".
Cl:	chloride concentration. Numeric field with format "nnnnn.nn".
Cl_trace:	trace symbol for chloride concentration value.
SO4:	sulphate concentration. Numeric field with format "nnnnn.nn".
SO4_trace:	trace symbol for sulphate concentration value.
NO3:	nitrate concentration. Numeric field with format "nnnnn.nn".
NO3_trace:	trace symbol for nitrate concentration value.
CO3:	carbonate concentration. Numeric field with format "nnnnn.nn".
CO3_trace:	trace symbol for carbonate concentration value.
HCO3:	bicarbonate concentration. Numeric field with format "nnnnn.nn".
HCO3_trace:	trace symbol for bicarbonate concentration value.
F:	fluoride concentration. Numeric field with format "nnnnn.nn".
F_trace:	trace symbol for fluoride concentration value.
Na:	sodium concentration. Numeric field with format "nnnnn.nn".
Na_trace:	trace symbol for sodium concentration value.
K:	potassium concentration. Numeric field with format "nnnnn.nn".
K_trace:	trace symbol for potassium concentration value.
Ca:	calcium concentration. Numeric field with format "nnnnn.nn".
Ca_trace:	trace symbol for calcium concentration value.
Mg:	magnesium concentration. Numeric field with format "nnnnn.nn".
Mg_trace:	trace symbol for magnesium concentration value.
Fe:	iron concentration. Numeric field with format "nnnnn.nn".
Fe_trace:	trace symbol for iron concentration value.
Si:	silica concentration. Numeric field with format "nnnnn.nn".
Si_trace:	trace symbol for silica concentration value.
Al:	aluminium concentration. Numeric field with format "nnnnn.nn". (note: no aluminium values present in the database)
AL_trace:	trace symbol for aluminium concentration value.
B:	boron concentration. Numeric field with format "nnnnn.nn".
B_trace:	trace symbol for boron concentration value.
PO4:	phosphate concentration. Numeric field with format "nnnnn.nn".
PO4_trace:	trace symbol for phosphate concentration value.
HCO3_Cl:	bicarbonate/chloride ratio. Numeric format "nnnnn.nnnnn".

5.4 GLVFLOW

This view holds stationary flow measurements made during flowmeter logging.

state:	state code, (n for NSW, q for Queensland, s for South Australia, t for Northern Territory). Character field of length one.
boreid:	state registration number or bore name. Character field with a maximum length of six characters.
dupid:	code of duplicate log for the bore, null for first geophysical log recorded, "b","c","d" etc for subsequent logs. Character length 1, range "b"- "z"

depth: Depth from ground surface in feet, at which flow measurement was made. Numeric field with format "nnnn.n".

rps: flow rate, in impeller flowmeter revolutions per second. Numeric field with format "nnnn.n".

5.5 GLVSTRAT

This view holds lithostratigraphic data that were interpreted from the geophysical logs by Dr B.R. Senior & Associates, Pty. Ltd while under contract to AGSO.

state: state code, (n for NSW, q for Queensland, s for South Australia, t for Northern Territory). Character field of length one.

boreid: state registration number or bore name. Character field with a maximum length of six characters.

form: formation abbreviation. Character field with maximum length 12.

formation_name: name of the formation, Character field of maximum length 30.

depth_top: depth to top of unit from ground surface (feet). Numeric field with format "nnnnn.n"

depth_bot: depth to bottom of unit from ground surface (feet). Numeric field with format "nnnnn.n"

5.6 GLSGEN

The GLSGEN view holds the bore location and bore name of each bore, along with the year that drilling was completed, the depth of the bore, the greatest depth reached by both the original and digitised geophysical logs, and the elevation of the bore. Note that the total depth (tot_depth) of the bore may be considerably different from the maximum depth of the digitised wire-line logs: the bore may have been deepened after its initial construction, the bore may also have become blocked at some point, preventing wire-line logging below the depth of the obstruction.

state: state code, (n for NSW, q for Queensland, s for South Australia, t for Northern Territory). One character.

boreid: state registration number or bore name. Character field with a maximum length of six characters.

state_name: the full name of the state.

lat_DMS: latitude, in degrees, minutes and seconds. Character field, format "nn nn nn" (positive southwards)

lon_DMS: longitude, in degrees, minutes and seconds, format "nnn nn nn"

lat_dec: latitude, as a decimal number, format "nn.nnnnnnnn" (positive southwards)

lon_dec: longitude, as a decimal number, format "nnn.nnnnnnnn"

utm_zone: universal transverse mercator zone, numeric, format "nn" (range 53-56)

UTM_east: UTM easting, meters, numeric, format "nnnnnnnnnnnn.nn"

UTM_nort: UTM northing, meters, numeric, format "nnnnnnnnnnnn.nn"

map_250: UTM 1:250 000 mapsheet code. A character field, format "SA₁-5A₂", where A₁ is in the range "C"- "I", and A₂ is in the range "3"- "6".

map_name: 1:250 000 mapsheet name, of maximum length 25 characters.

name: full name of bore. Character field of maximum length 35.

elev: elevation of groundsurface in feet with respect to the Australian height datum. (AHD). Numeric field with format "nnnnn.n"

elev_meth: method by which elevation was measured.

tot_depth: total depth of bore in feet, measured from groundsurface. Numeric field with format "nnnnn.n"

dig_log_depth: greatest depth of digital copies of any of the logs for this bore, in feet, measured from groundsurface. Numeric field with format "nnnnn.n".

year_comp: year the initial drilling was completed. Numeric field, with format "nnnn", and with values in the range 1870-1999.

5.7 GLSLOG

This view holds descriptions of each geophysical log, and the scales and formats in which the data is available. The original geophysical logs are available in both 1 inch:20 foot and 1 inch: 100 foot scales. Some logs are available at other scales. The originals were recorded on transparent film, and the original films and paper copies held at AGSO. The tran1_20, tran1_100, tran_alt, pap1_20, pap1_100, pap_alt fields indicate the media and scale of original logs. Where a scale other than 1 inch: 100 foot or 1 inch: 20 foot has been used for the original log, this scale is indicated in the tran_alt_sc or pap_alt_sc fields. The scale of the original log that was digitised to produce a log for distribution on the CD-ROM is stored in the dig_log_sc field.

state: state code, (n for NSW, q for Queensland, s for South Australia, t for Northern Territory). Character field of length one.

boreid: state registration number or bore name. Character field with a maximum length of six characters.

map_250: UTM 1:250 000 mapsheet code. A character field, format "SA₁-5A₂", where A₁ is in the range "C"-I", and A₂ is in the range "3"-6".

lat_DMS: latitude, in degrees, minutes and seconds. Character field, format "nn nn nn" (positive southwards)

lon_DMS: longitude, in degrees, minutes and seconds, format "nnn nn nn"

log_type: type of the geophysical log. Character string of length 1-3. One of the following:

gr	natural gamma ray
neu	neutron-gamma ray
t	temperature
dt	differential temperature
cal	caliper
fld	flow (logged downwards)
flu	flow (logged upwards)
rln	long normal resistivity
rlt	lateral resistivity
rsn	short normal resistivity
sp	spontaneous potential
spr	single point resistance

dupid: code of duplicate log for the bore, null for first geophysical log recorded, "b","c","d" etc for subsequent logs. Character length 1 or 0, range "b" - "z"

dig_name: name of the file containing the digitised log data (MS-DOS compatible). Character field with format "ABBBBBBC.DDD" where A is the state code,

BBBBBB is the bore i.d., C is the duplicate code (if present), and DDD is the log type.

log_top: highest depth logged relative to groundsurface, feet. Numeric field with format "nnnnn.n".

log_bot: lowest depth logged relative to groundsurface, feet. Numeric field with format "nnnnn.n".

log_unit: units of the geophysical log, character, length 10.

log_dir: upwards or downwards movement of the probe during logging. Character field of maximum length 4, with two permissible values, "up" or "down".

log_year: the year the bore was logged. Numeric field with format "nnnn".

temp_top: the temperature of the groundwater at groundsurface, in degrees Celsius. Is only non-null for temperature logs. Numeric field with format "nnn.nn".

temp_bot: the temperature of the groundwater at the bottom of the bore, in degrees Celsius. Only used for temperature logs. Numeric field with format "nnn.nn".

tran1_20: available as transparent original at 1"-20' depth scale ? Character field with value of either "y" or "n".

tran1_100: available as transparent original at 1"-100' depth scale ? Character field with value either "y" or "n".

tran_alt: available as transparent original at non-standard scale ? Character field with value either "y" or "n".

tran_alt_sc: alternate depth scale of log on transparent original. Character field with maximum length 15.

pap1_20: available as paper copy at 1"-20' depth scale ? Character field with value either "y" or "n".

pap1_100: available as paper copy at 1"-100' depth scale ? Character field with value either "y" or "n".

pap_alt: available as paper copy at non-standard scale ? Character field with value either "y" or "n".

pap_alt_sc: alternate depth scale of log on paper copy. Character field with maximum length of 15 characters.

dig_log_sc: the scale of the hardcopy log from which the wire-line log was digitised. Character field with maximum length 15.

owner: the owner of the log. Character field of maximum length 60.

comments: description of any problems encountered during the geophysical logging of the bore, or any problems encountered during digitising of the geophysical wire-line log. Character field of maximum length 100.

5.8 GLSCHEM

This view stores the results of hydrochemistry data analyses for each bore sampled for hydrochemistry. The various trace fields for ionic concentration fields may have one of the following values:

T	traces detected
N	not detected
<	actual value is less than the stated value

state: state code, (n for NSW, q for Queensland, s for South Australia, t for Northern Territory). Character field of length one.

boreid: state registration number or bore name. Character field with a maximum length of six characters.

map_250: UTM 1:250 000 mapsheet code. A character field, format "SA₁-5A₂", where A₁ is in the range "C"-I", and A₂ is in the range "3"-6".

lat_DMS: latitude, in degrees, minutes and seconds. Character field, format "nn nn nn" (positive southwards)

lon_DMS: longitude, in degrees, minutes and seconds, format "nnn nn nn"

dupid: code of duplicate analysis for the bore, null for first geophysical log recorded, b,c,d etc for subsequent logs. Character field of length one, range "b"-z".

lab_ref: laboratory reference number of the sample. Character field, maximum length of 20 characters.

lab: name of the organisation which analysed the chemical samples. Character field of maximum length 60.

site: description of the sample site. Character field of maximum length 40.

date_samp: date the sample was taken.

date_anal: date the sample was analysed.

conc: concentration units for ionic analyses, either "ppm" for parts per million, or "mg/l" for milligrams per litre. Character field of maximum length 4.

pH: pH of the sample. Numeric field with format "nn.nn"

cond: sample electrical conductivity, in microsiemens/cm. Numeric field with format "nnnnn".

TDS_est: estimated TDS in ppm (parts per million). Numeric field with format "nnnnnn".

alkalinity: as CaCO₃ in ppm. Numeric field with format "nnnnn".

tot_hard: total hardness as calcium and magnesium salts as CaCO₃ in ppm. Numeric field with format "nnnnn.nn".

Cl: chloride concentration. Numeric field with format "nnnnn.nn".

Cl_trace: trace symbol for chloride concentration value.

SO4: sulphate concentration. Numeric field with format "nnnnn.nn".

SO4_trace: trace symbol for sulphate concentration value.

NO3: nitrate concentration. Numeric field with format "nnnnn.nn".

NO3_trace: trace symbol for nitrate concentration value.

CO3: carbonate concentration. Numeric field with format "nnnnn.nn".

CO3_trace: trace symbol for carbonate concentration value.

HCO3: bicarbonate concentration. Numeric field with format "nnnnn.nn".

HCO3_trace: trace symbol for bicarbonate concentration value.

F: fluoride concentration. Numeric field with format "nnnnn.nn".

F_trace: trace symbol for fluoride concentration value.

Na: sodium concentration. Numeric field with format "nnnnn.nn".

Na_trace: trace symbol for sodium concentration value.

K: potassium concentration. Numeric field with format "nnnnn.nn".

K_trace: trace symbol for potassium concentration value.

Ca: calcium concentration. Numeric field with format "nnnnn.nn".

Ca_trace: trace symbol for calcium concentration value.

Mg: magnesium concentration. Numeric field with format "nnnnn.nn".

Mg_trace: trace symbol for magnesium concentration value.

Fe: iron concentration. Numeric field with format "nnnnn.nn".

Fe_trace: trace symbol for iron concentration value.

Si: silica concentration. Numeric field with format "nnnnn.nn"

Si_trace: trace symbol for silica concentration value.

Al: aluminium concentration. Numeric field with format "nnnnn.nn". (note: no aluminium values present in the database)

AL_trace: trace symbol for aluminium concentration value.

B: boron concentration. Numeric field with format "nnnnn.nn".

B_trace: trace symbol for boron concentration value.
PO4: phosphate concentration. Numeric field with format "nnnnn.nn".
PO4_trace: trace symbol for phosphate concentration value.
HCO3_Cl: bicarbonate/chloride ratio. Numeric format "nnnnn.nnnnn".

5.9 GLSFLOW

This view holds stationary flow measurements made during flowmeter logging.

state: state code, (n for NSW, q for Queensland, s for South Australia, t for Northern Territory). Character field of length one.
boreid: state registration number or bore name. Character field with a maximum length of six characters.
map_250: UTM 1:250 000 mapsheet code. A character field, format "SA₁-5A₂", where A₁ is in the range "C"- "I", and A₂ is in the range "3"- "6".
lat_DMS: latitude, in degrees, minutes and seconds. Character field, format "nn nn nn" (positive southwards)
lon_DMS: longitude, in degrees, minutes and seconds, format "nnn nn nn"
dupid: code of duplicate log for the bore, null for first geophysical log recorded, "b", "c", "d" etc for subsequent logs. Character length 1, range "b"- "z"
depth: Depth from ground surface in feet, at which flow measurement was made. Numeric field with format "nnnn.n".
rps: flow rate, in impellor flowmeter revolutions per second. Numeric field with format "nnnn.n".

5.10 GLSSTRAT

This table holds lithostratigraphic data that were interpreted from the geophysical logs by Dr B.R. Senior & Associates, Pty. Ltd while under contract to AGSO.

state: state code, (n for NSW, q for Queensland, s for South Australia, t for Northern Territory). Character field of length one.
boreid: state registration number or bore name. Character field with a maximum length of six characters.
map_250: UTM 1:250 000 mapsheet code. A character field, format "SA₁-5A₂", where A₁ is in the range "C"- "I", and A₂ is in the range "3"- "6".
lat_DMS: latitude, in degrees, minutes and seconds. Character field, format "nn nn nn" (positive southwards)
lon_DMS: longitude, in degrees, minutes and seconds, format "nnn nn nn"
form: formation abbreviation. Character field with maximum length 12.
formation_name: name of the formation, Character field of maximum length 30.
depth_top: depth to top of unit from ground surface (feet). Numeric field with format "nnnnn.n"
depth_bot: depth to bottom of unit from ground surface (feet). Numeric field with format "nnnnn.n"

6. DISTRIBUTION OF GABLOG DATA ON CD_ROM

All distributable data is distributed on an ISO 9970 format CDROM. All data stored in ASCII files are also stored in MS-DOS text format, with each line terminated by a carriage return character and a line feed character.

The directory structure of the wire-line log CD-ROM can be seen in Figure 4.

Database tables from the GABLOG database are stored as ASCII formatted CSV files (comma separated values), with strings enclosed in double quotes. The first line of each CSV file lists the name of each database field (or spreadsheet column). The database tables are also stored in Oracle 7 export format - this format is useful for those endusers wishing to import the data into an Oracle 7 database. The files holding the data for conversion to database systems (as described in previous sections of this document) are held in:

Table Name	CSV ASCII File
glvchem	/database/database/glvchem.csv
glvflow	/database/database/glvflow.csv
glvgen	/database/database/glvgen.csv
glvlog	/database/database/glvlog.csv
glvstrat	/database/database/glvstrat.csv

The files holding the data for conversion to spreadsheets (as described in previous sections of this document) are held in:

Table Name	CSV ASCII File
glschem	/database/spread/glvchem.csv
glsflow	/database/spread/glvflow.csv
glsgen	/database/spread/glvgen.csv
glslog	/database/spread/glvlog.csv
glsstrat	/database/spread/glvstrat.csv

Sample of a CSV database file (glvstrat.csv):

```

The digitised wire-line logs are stored as ASCII files, with each line of data terminated with a carriage return and linefeed. The first line in the file consists of a descriptor string: this string starts with the characters "BMR GAB" (for Bureau of Mineral Resources, Great Artesian Basin Project), followed by the state in which the water bore is located, the registered number or name of the water bore, and the type of the log. The second line of the log gives the units for the depth (feet in all cases) and units for the measured parameter (for example, inches for caliper logs). The third line is always blank. On the fourth and subsequent lines, two numeric values appear, the first value is the depth of measurement from the top of the bore or kelly bushing, the second value is the value of the measured parameter.

Digitised wire-line logs are stored in directories holding all geophysical wire-line logs of a specific type. The name of each digitised wire-line log file is composed of a letter specific to the state, then the registered number (or name) of the bore, one letter indicating if the log is a duplicate, then a file name extension representing the wire-line log type. The digitised logs are held on the CD-ROM in the directories below the /logs directory.

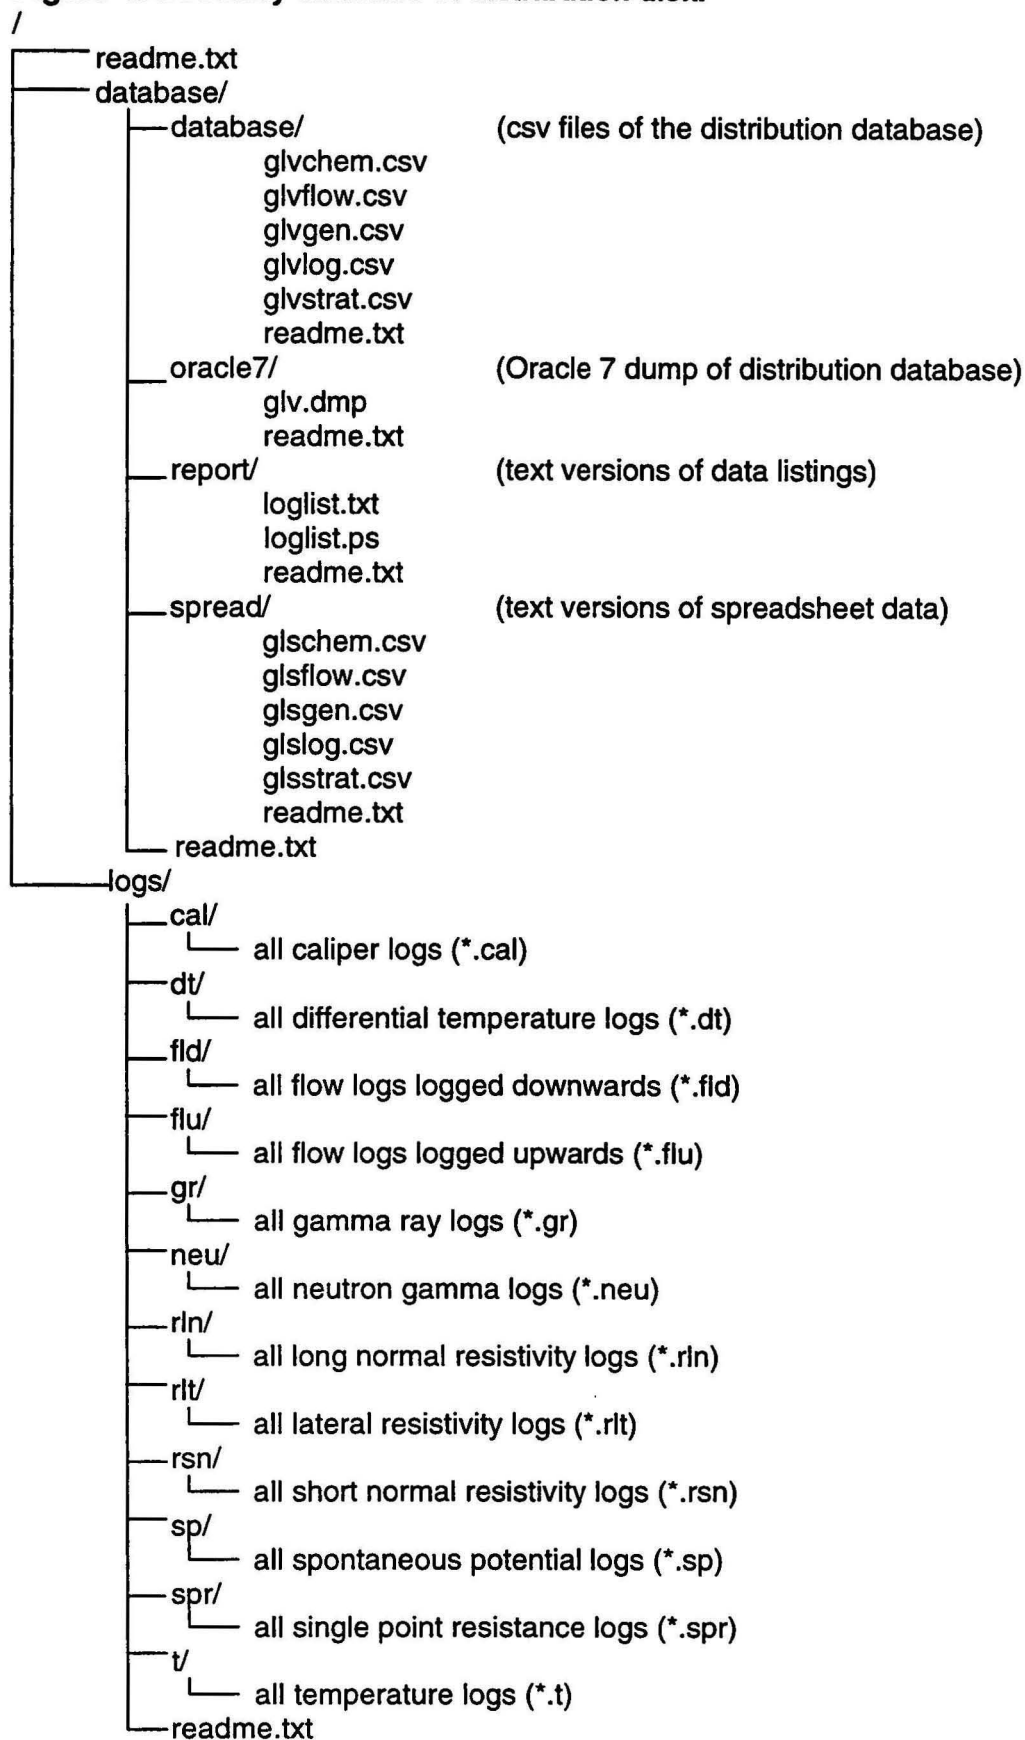

To determine the location of a wire-line log on the CD-ROM, note the state in which the bore is located, the registered number of the bore, the type of the wire-line log, and duplicate letter of the log (if more than one wire-line log is present) from the wire-line log database. For example, if the registration number of the bore is "1946", and the bore is located in Queensland (state code "q"), and the desired log type is caliper (type code "cal"), then the digitised wire-line log will be located on the CD-ROM in "/logs/cal/q1946.cal".

Sample of a digitised geophysical wire-line log (/logs/cal/n32500.cal):

BMR GAB NSW RN 32500 CAL		
Feet	Inches	
		<- line 1
		<- line 2
		<- line 3
0.50	5.62	<- line 3
1.00	5.62	<- line 4
1.50	5.82	<- line 5
2.00	5.82	<- line 6
2.50	5.82	<- line 7
3.00	5.78	<- line 8
3.50	5.78	<- line 9
4.00	5.77	<- line 10
4.50	5.77	<- line 11
5.00	5.77	<- line 12
5.50	5.77	<- line 13
6.00	5.77	<- line 14
6.50	5.77	<- line 15
7.00	5.77	<- line 16

A listing of the contents of the database is held as a text file and a postscript 2 file. The textfile (/database/report/loglist.txt) must be reformatted with a wordprocessor prior to printing. The postscript 2 version of the same file (/database/report/loglist.ps) may be printed on a compatible printer on A4 paper.

Figure 4: Directory structure of distribution disk.

7. Acknowledgments

Nick Revell and Aaron Sedgmen digitised the wire-line logs, and compiled some of the data for the database. Mirek Kucka provided information and comments during database design and implementation. Dr Rien Habermehl answered queries concerning the nature of the data. Both Mirek Kucka and Dr Rien Habermehl reviewed an earlier version of this record.

Appendix i: Listings of Tables Definitions and Constraints

This appendix lists table definitions and constraints used to implement the GABLOG database.

The first column in the constraint listing is the name of the constraint. The following constraint naming convention has been used in the GABLOG database:

- The name of the table to which the constraint is applied forms the first part of the constraint name. This table_name component is separated from the rest of the constraint name by a "\$".
- The next part of the constraint name is made up of the names of the fields to which the constraint is applied.
- The last portion of the constraint name is the type of the constraint. The type of the constraint and its abbreviation as used in the GABLOG database may be one of:

nn	not null constraint
pk	primary key constraint
uk	unique key constraint
rf	referential integrity constraint
fk	foreign key constraint
yn	the field is limited to either a "y" or a "n" value
low	the field value must be greater than or equal to some specified value
gt	the field value must be greater than some specified value
rn	the field value must be within a range of values

The second column in the constraint listing gives the constraint type as specified to the Oracle RDBMS during table creation. The Oracle constraint type may be "remote" for a constraint used to enforce referential integrity, "column" for a check constraint on a column, "Prim. Key" for a primary key constraint, and "Uniq. Key" for a unique key constraint.

The third column in the constraint listing gives the name of any primary or unique key constraints that have been defined for any remote constraints.

The fourth column of the constraint listing gives the search condition specified for column check constraints.
