MICROPALAEONTOLOGICAL EXAMINATION OF SAMPLES FROM BORE NO. 3897

ON THE PROPERTY OF C.M. & W.E. TAYLOR, URELLA DOWNS, WHITE CLIFFS,

N. NEW SOUTH WALES.

Report No.1947/13

(Copy 1)

<u>1,125 -1,164 feet.</u>	Hard grey limestone.
<u>1,200 feet.</u>	Grey carbonaceous shale with foraminifera (<u>Trochammina</u> sp., <u>Lenticulina warregoensis</u>) and shell fragments.
<u>1,250 -1,300 feet.</u>	Grey carbonaceous shale with shell fragments.
<u>1,315 - 1,350 feet.</u>	Grey carbonaceous shale with some coaly particles.
<u>1,389 feet.</u>	Hard grey limestone.
<u>1,400 - 1,450</u>	Grey carbonaceous shale.

NOTES ON THE SAMPLES.

The series of samples submitted for examination came from the depth of 1,125 feet down and 1,450 feet, and are included in the Lower Cretaceous. Typical foraminifera were recognised only in the sample at 1,200 feet.
