

Side Scan Sonar Paths & Interesting Features

In August 2005, Parks Australia North Cocos (Keeling) Islands (PANCKI), (courtesy of Robert Thorn) provided Geoscience Australia (GA) with sidescan sonar video footage taken from the shipping channel from the north-eastern lagoon entrance through to the blue hole or the oil-tanker moorings. The video footage was supplied on CD-Rom viewable with accompanying software (Imagenex Model 881 Sportscan Digital Sidescan Sonar V1.20).

The video footage was taken over eight days (20-23/11/2002; 4/12/2002; 5/3/2003; 11/3/2003 & 17/3/2003) by Don Shepherd, subcontracted by GHD Pty Ltd and funded by DoTaRS. The purpose of this survey was to confirm the shipping channel and was the final survey before the shipping channel could be opened. It was conducted to ensure that previous contractors had adequately removed obstructions such as coral bombies and placed markers appropriately.

Positional accuracy of the sidescan sonar has not yet been received by GA. The instrument trails

the shipping vessel on a cable of variable length. Errors are introduced depending on the length of this cable, and also depending on currents within the water-body. GA is as yet to receive information regarding the cable length used or whether corrections have been made to the sidescan sonar data. GA has tested various locations along the sidescan sonar paths for accuracy. This was done by correlating the path with features observed in the 1987 Orthophotography. From these test locations, GA believes errors to be within +/- 10m. An example of these test locations can be seen in Figure 5 below.

Figure 1: IMAGENEX Sportscan Digital Sidescan Sonar device

Shapefiles have been built from this data to show the paths taken by the sidescan sonar vessel. These were created using the longitude and latitude displayed from the beginning and end of the image paths. It should be noted however that this method assumes the vessel to be moving in a straight line throughout the footage. As the lines have been compiled with only the beginning and end point data it is possible that the vessel did not maintain this straight path and therefore errors may be evident due to this assumption. A coverage of lines was built and projected into UTM Zone 47S (WGS84).

A second shapefile has also been created which shows anomalies noticed by GA within the sidescan sonar footage that may be of interest, such as that in Figure 2 below. The shapefile was produced using the latitude and longitude of the particular point of interest, and was then projected to UTM Zone 47S (WGS84). These two shapefiles are shown below overlayed on the 2003 satellite imagery.

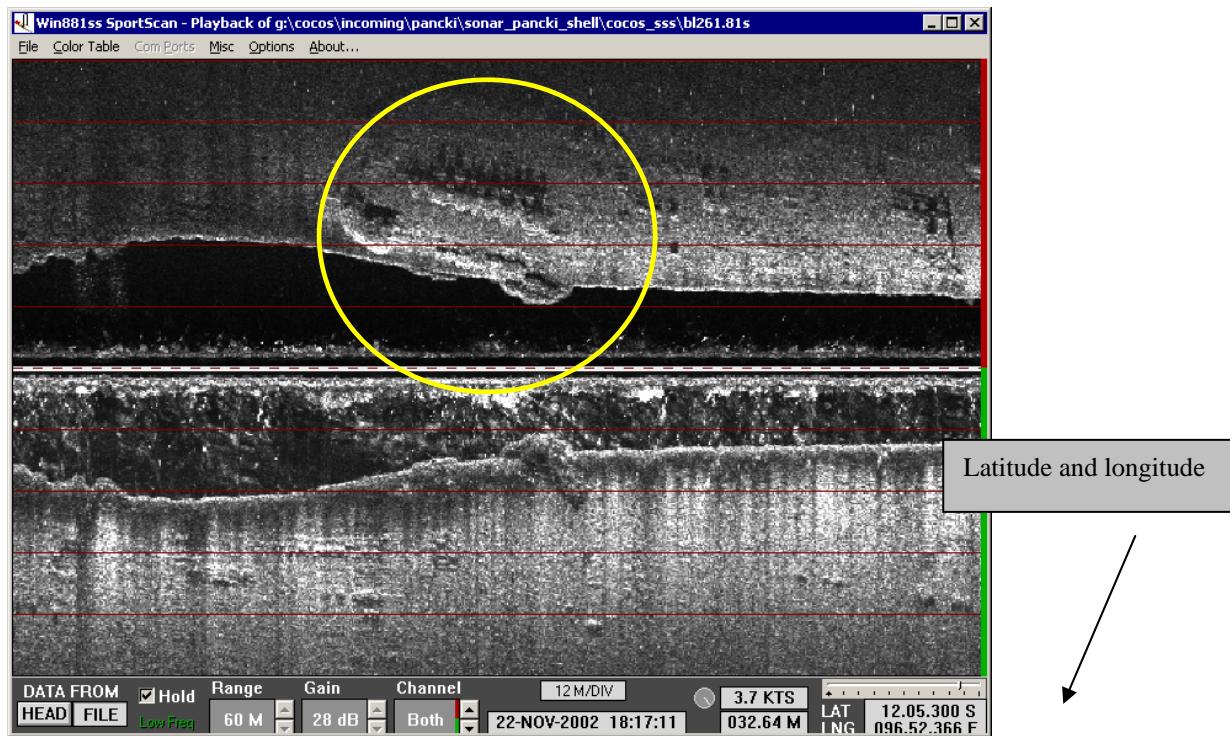

Figure 2. An anomaly within the Side Scan Sonar footage.

GA is as yet unable to provide an explanation of what these anomalies are. Evidence suggests they could be a combination of natural features such as coral bombs or rock strata, or anthropogenic features such as foundations of past or present navigation markers or perhaps a sunken vessel or war wreckage. Screen captures of these areas have been included on the adjoining pages.

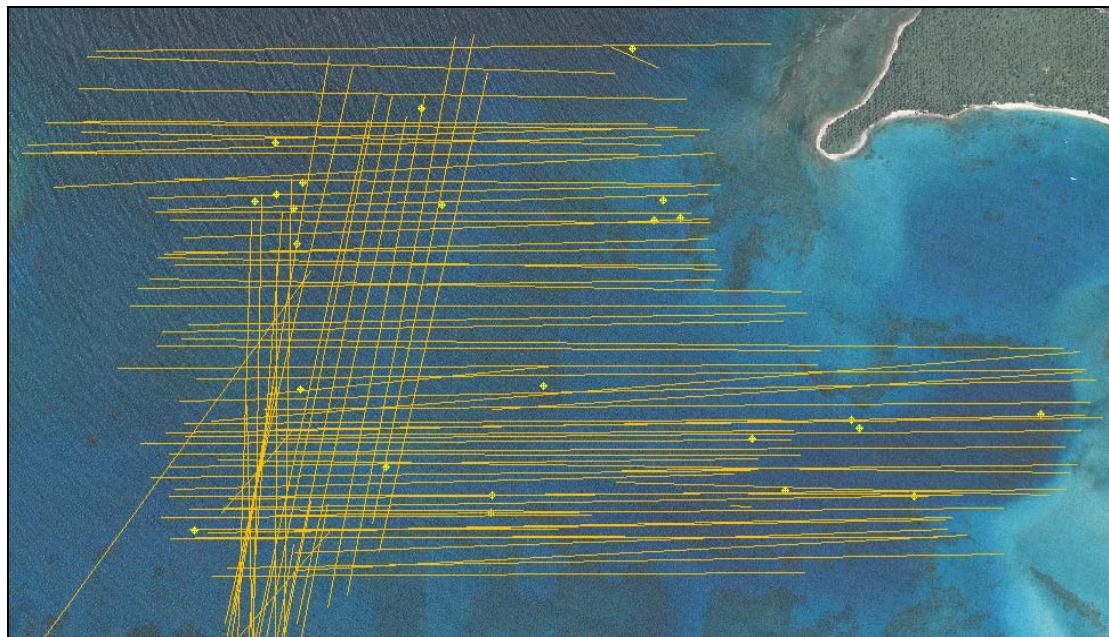

Figure 3 – Side Scan Sonar paths and interesting points overlaid onto the 2003 satellite imagery.

By overlaying these shapefiles with the 2003 satellite imagery and, where available, the 1987 orthophotography, correlation is evident between rock and coral covered patches of the sea-floor and that data footage captured by the sidescan sonar. This can be seen by comparing the following sidescan sonar image and the 1987 orthophotography of the same area.

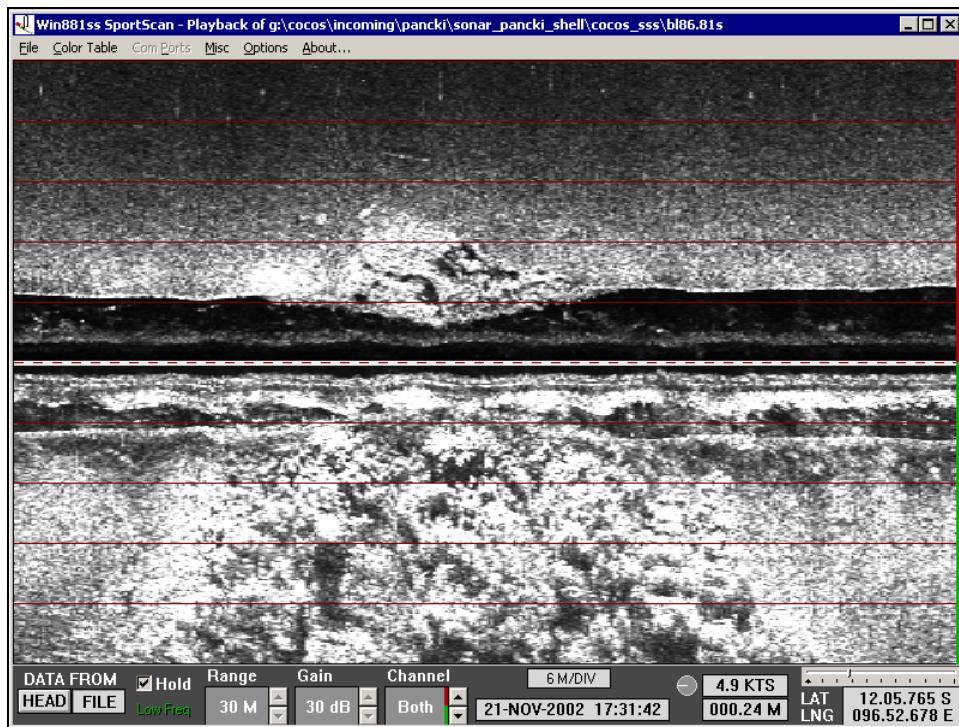

Figure 4: Sidescan sonar image of an area near the Blue Hole. Correlation can be seen between the sonar footage and the satellite image shown below.

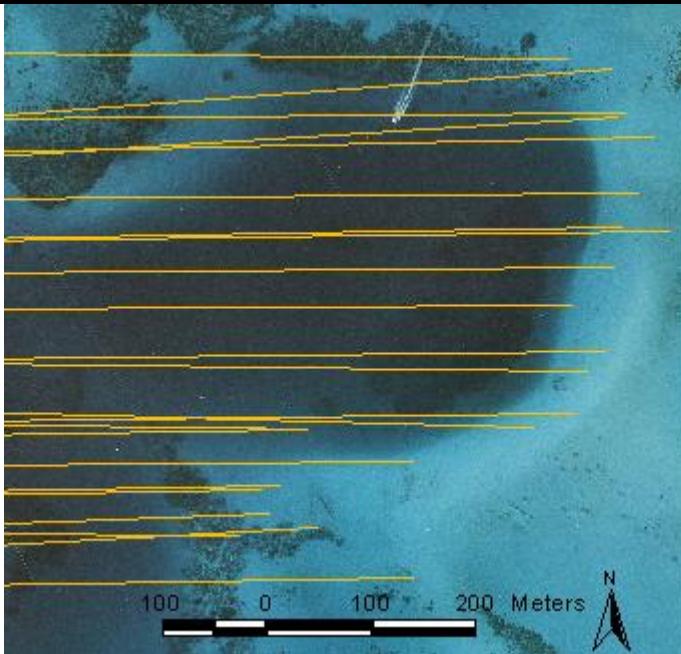

Figure 5: 1987 Orthophotography of the area captured in the sonar footage displayed in Figure 4. Correlation can be seen between the two images (note that the vessel was travelling from east to west). Yellow crosses indicate the edge of the coral patch as seen in the sidescan sonar video footage. Errors are evident between this video footage and the Orthophotography.

GA understands the dark band in the middle of the sidescan sonar footage to represent the wake of the boat. Due to the sonar equipment needing to drop 3-4 meters below the boat, it was necessary for water depth to be at least 5 meters. Paths are attributed with the video footage filename. (e.g. bl96.81s, where bl=blue hole and .81s refers to the equipment model. Other prefixes are ch=channel, cl=clearance area, tr, newcl, and south). PANCKI have expressed an interest in investigating some of these anomalies by diving the areas.

Sidescan Sonar

— Sonar Paths

Dataset

Title	Sidescan Sonar Paths
Custodian	Geoscience Australia
Jurisdiction	Australia

Description

Abstract	This dataset shows paths taken by a vessel holding a Sidescan Sonar instrument within the waters of the Cocos (Keeling) Islands used by cargo ships.
Search Word(s)	SONAR Marine
Geographic Extent Name(s)	Cocos (Keeling) Islands

Data Currency

Beginning Date	20NOV2002
Ending Date	17MAR2003

Dataset Status

Progress	Complete
Maintenance and Update Frequency	not planned

Access

Stored Data Format	DIGITAL - ESRI Shapefile
Available Format Type	DIGITAL - ESRI Shapefile

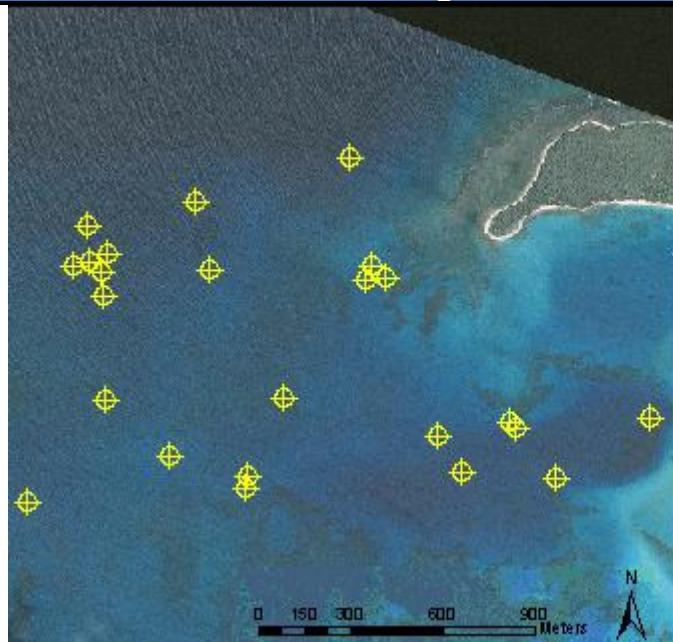

Access Constraint	See contact details below.
Data Quality	
Lineage	<p>This data was originally provided as sonar video footage on CD-Rom, viewable with accompanying software (Imagenex Model 881 Sportscan Digital Sidescan Sonar V1.20). Using the latitude and longitude displayed at the beginning and end of the paths, the shapefile was made to represent the paths of the Sidescan Sonar. The shapefile represents the paths assuming travel was in a straight line from beginning to end. It is possible that the vessel wavered from this path.</p> <p>The data was projected to UTM (WGS84) zone 47S using ArcView.</p>
Positional Accuracy	GA received little information regarding the positional accuracy of the sonar video footage. The cable length from the shipping vessel to the sidescan instrument is unknown and may cause errors in the data. It is also unknown whether corrections were performed to allow for movement of the instrument due to water currents. GA however believes errors to be within +/- 10m. Latitude and Longitude were both given to a hundredth of a minute.
Attribute Accuracy	The table attributes describe the path number.
Logical Consistency	The themes are used to describe the Sidescan Sonar paths.
Completeness	Is complete for the Sidescan Sonar footage which was provided by PANCKI.
